

DIGITAL GARMENT PRINTING

Digital Garment Printing involves the use of a highly modified printer with specially formulated garment inks that transfer your image from the computer straight to your garment. They are then heat set with our tunnel dryer. Unlike screen printing, DTG output does not require separations, films and screens, allowing photographs to be printed on your items. Once your artwork is ready on the computer it is output directly onto the garment. Because of the lack of steps required in this process, short run orders can be quickly produced with an infinite amount of colors.
